SUBJECT: VOC COMPLIANCE CERTIFICATE

VINALOPÓ ALUMINIO COLOR SL, CERTIFIES;

We hereby certify that the pre-painted aluminum coils supplied to our customer have been coated at our manufacturing facilities in VIALCO, Spain, in accordance with our standard industrial coil coating process.

The coating system used complies with a VOC content below 100 g/l. It is normal for industrial coating systems to contain certain components such as Volatile Organic Compounds (VOCs), solvents, and isocyanates, which are necessary for proper paint application and performance. These components are applied exclusively within the painting line.

During the curing process, the coated aluminum coils pass through high-temperature ovens, where these substances evaporate completely. The resulting vapors are subsequently treated and thermally oxidized in our Regenerative Thermal Oxidizer (RTO) system.

As a result of this controlled process, none of these substances remain on the pre-painted aluminum coils supplied to the customer.

Therefore, we confirm that the delivered prepainted aluminum coils:

- Comply with the request of VOC content < 100 g/l
- Do not contain residual solvents, VOCs, or isocyanates on the finished product

This certificate is issued for quality assurance and customer compliance purposes.
